

Ollama Tool

- The Ollama tool is used to run large language models (LLMs locally on your own computer, instead of using cloud-based AI like ChatGPT).
- - a. Run AI models locally
- Ollama lets you download and run models such as: LLaMA Mistral Gemma Phi Code-focused models ...directly on your laptop or server.
- This means: No internet required after setup Your data never leaves your machine Faster responses for local development
- Ollama is a tool that lets you run large language models (LLMs locally on your own computer), instead of using cloud-based AI services.
- In simple terms: Ollama turns your laptop into a mini-AI server.
- Feature Description
 1. Local AI - Runs models on your own machine
 2. Privacy - Data never leaves your device
 3. Offline - Works without internet
 4. CLI - Easy command-line usage
 5. API - Connect with Python / JS
 6. Model library - Many open-source LLMs
 7. Custom models - Create your own behaviors
 8. Free - No API costs

Everything about Ollama in simple terms

- Ollama is a tool that lets you run AI like ChatGPT on your own computer.
- Instead of using the internet and paying for APIs, Ollama lets your laptop think locally.
- Think of it like this:
 1. ChatGPT - AI on the internet
 2. Ollama - AI inside your computer
- Why Ollama exists
- Normally, AI models:
 1. live on big company servers
 2. need internet
 3. cost money
 4. send your data outside
- Ollama solves this by letting you:
 1. download AI once
 2. run it offline
 3. keep your data private
 4. use it freely

- Ollama helps you do 4 main things:
- 1. Download AI models
- 2. Run the AI locally
- 3. Act as a local AI server
- 4. Manage models automatically

Download a file from ollama

- we can download a file from ollama using cmd
- first call ollama
- then check the list of files you downloaded from ollama using `ollama.ls`
- then to download a file use `ollama pull` *paste the file name copied from models*
- wait until the file gets downloaded
- to check call `ollama.ls` to see the file if its downloaded
- now you have to run the file using `ollama run` *paste the file name copied from models*
- ask questions now.

Code Explanation on vscode

- `import streamlit as st` (used to build a web app using Python)
- `from ollama import Client` (lets your Python app talk to Ollama models running locally)
- `client = Client(host="http://localhost:11434")` (Connect my Python app to the Ollama server at port 11434)
- `st.set_page_config( page_title="Custom LLM model by Srushti Thakur - Ollama", layout="centered")` (Browser tab title - Custom LLM model by Srushti Thakur - Ollama
Page layout - centered instead of wide)
- `st.title("Mrs. Srushti Thakur - Ollama App")` (Page title)
- `prompt = st.text_area("Enter your prompt:", height=200)` (multiline text box , where User types their question or instruction here.)
- `if st.button("Generate Response"):` (Code inside runs only when user clicks the button)
- `if prompt.strip() == "": st.warning("Please enter a prompt.")` (`strip()` removes spaces, Prevents sending empty prompts to the model, Shows a yellow warning message)
- `with st.spinner("Thinking..."):` (thinking mode activated)
